

fireflies.ai

PRODUCT MANAGEMENT CAPSTONE

From Meeting Notes to Closed Commitments

Turning extracted commitments into tracked, owned items that reach honest closure — raising 14-day resolution from 28% to 45%.

Prepared for Fireflies.ai Leadership · Airtribe Product Management Launchpad

Prototype

Automation

Metrics

Why → What → How → What's Next

WHY

The Problem

Fireflies captures commitments perfectly, but only 28% reach closure within 14 days. Extraction isn't the gap — follow-through is.

WHAT

The Research & Insight

15+ interviews across creators, managers, and external-dependency workflows reveal the real barrier: a passive 'write-only' memory layer.

HOW

The Solution & Experience

A Closed-Loop Execution Engine — context-aware smart nudges, AI check-ins, and a working prototype + live automation.

WHAT'S NEXT

Scale & Measurement

Bottom-up adoption, a growth loop, cohort rollout, and a North Star metric that proves the shift from 28% to 45%.

MARKET CONTEXT

- AI meeting assistants are a crowded, commoditizing category — Otter.ai, Read AI, MeetGeek, Granola, plus native Zoom/Teams/Meet features.
- Transcription accuracy and action-item extraction are becoming table stakes, not differentiators.
- Fireflies already does capture and extraction well. No competitor has solved whether commitments actually get closed.
- Growth is bottom-up: individuals bring the tool into meetings before any org-wide decision — meaning any new capability must earn adoption the same way.

Extraction Is Solved. Follow-Through Is Not.

When someone says in a meeting that they will do something, that promise currently has no home. It appears in a summary email sent to the whole room, and then depends entirely on the individual remembering it — or manually copying it somewhere else.

What Fireflies Does Today

- ✓ Records the meeting
- ✓ Produces a transcript + summary
- ✓ Identifies action items
- ✓ Sends a broadcast summary email

What Fireflies Doesn't Do

- ✗ Track who owns each commitment
- ✗ Know if it was actually completed
- ✗ Nudge anyone proactively
- ✗ Distinguish real closure from silence

A 'Write-Only' Memory Layer

Professional meetings capture commitments effectively, but they fail to reach closure because the post-meeting workflow acts as a write-only memory layer — leaving action items stranded in passive summaries without active lifecycle tracking, contextual follow-ups, or closed-loop accountability.

28%

of extracted commitments reach
resolution within 14 days

*"The client forgot about the pending documents"
— no automated follow-up mechanism existed to
bridge the gap.*

Survey respondent — client dependency

*"If the client would be reminded about the
pending documents like an auto-generated
email... then he might be able to send the
document by the deadline."*

Survey respondent — reminder gap

A COMMITMENT IS 'RESOLVED' WHEN:

Marked done · Reassigned to a different owner · Deliberately dropped (honest closure, not forced completion). Items that are silently ignored or simply repeated in a later meeting are NOT resolved.

Research Questions & Hypotheses

RESEARCH QUESTIONS

RQ1

What are the primary bottlenecks causing commitments to be delayed, forgotten, or left pending?

RQ2

How frequently do professionals manually copy-paste action items across tools like Notion, Slack, and spreadsheets?

RQ3

How comfortable are managers, founders, and ICs with AI automatically tracking commitment lifecycle and completion?

HYPOTHESES

H1

Commitments fail not from unwillingness, but lack of automated visibility, reminders, and multitasking fatigue.

H2

70%+ of professionals manually migrate action items into centralized tools (Notion, Jira) or Slack to stay on track.

H3

Users show high openness (4/5) to automated tracking if it reduces manual follow-up and provides smart, context-aware reminders.

RESEARCH PLAN — MULTI-STAKEHOLDER COVERAGE

Segment A

Individual Contributors

How they track personal commitments & handle delegation

Google Forms + remote interviews

Segment B

Managers / Team Leads

How accountability is enforced & visibility maintained

Structured questionnaires + workflow observation

Segment C

Founders / Executives

High-stakes commitments (investor, client) & cross-dept follow-ups

Survey feedback analysis

Four Interviews, One Consistent Pattern

PM at a SaaS Startup

Commitment: Shared updated PRD by Wednesday evening

Outcome: 24 hours late — pulled into production bug triage

"Capturing the commitment wasn't the problem. Keeping it visible when priorities changed was."

Marketing / Creative Lead

Commitment: 5 Diwali campaign ad copies

Outcome: Late — client changed brand guidelines mid-flight

"We used Read AI for extraction, but still manually created the Trello cards."

PM at IT Consultancy

Commitment: Client sign-off on UAT phase report

Outcome: Late — 2 UI bugs found, blocked on client stakeholder

"The sign-off depended on issues being resolved first — an external dependency."

Ops Head at Logistics SME

Commitment: Vendor dispatch of 50 pallet racks

Outcome: Missed — no automatic capture at all

"The system didn't proactively tell me. I had to notice the delay and escalate it myself."

Interview Reconstructions — Raw Evidence

PM at SaaS startup — captured on time, delayed by priority shift

Creative lead — manual Trello migration despite AI extraction

Respondent 7 — IT consultancy, client-dependency blocker

Respondent 10 — logistics, zero proactive system visibility

Four Stakeholders, Four Different Needs

User — Creator

Needs: Effortless capture of what they agreed to, without manual note-taking

Pain: Forgetting details or tasks buried in raw transcripts

Manager — Overseer

Needs: Clear visibility into team bandwidth and deliverable status

Pain: Having to chase team members in meetings for status updates

Administrator — IT / Workspace

Needs: Secure integrations with enterprise directory, Slack, Workspace, Jira

Pain: Data privacy concerns with third-party meeting bots

Buyer — Decision Maker

Needs: Measurable ROI: productivity, reduced slippage, closed deals

Pain: Paying for disconnected tools that never close the loop

No One Has Solved Closed-Loop Tracking

CAPABILITY	NATIVE ZOOM/TEAMS	OTTER / READ AI	FIREFLIES (NOW)	PROPOSED TARGET
Transcription	Basic/Limited	High	High	High + Contextual Enrichment
Action-Item Extraction	Minimal	Moderate	High	High + Auto Categorization
Lifecycle Tracking	No	No	Limited/Manual	Automated Closed-Loop + Nudges
Multi-Tool Sync	Manual	Partial	Good	Seamless Bi-directional Sync

TOP ANTICIPATED BARRIERS

Bot Fatigue & Privacy

Users hesitate to invite more AI bots into sensitive client/management meetings

Behavioral Inertia

Teams are habituated to manual Slack/Notion pasting — breaking this needs undeniable automation value

External Stakeholder Friction

Clients outside internal tools can't be forced into automated tracking loops

Two Incentives Pulling in Opposite Directions

COMMITMENT OWNER

Incentive: Deep work, execution, protecting flow state.

Friction: Status updates & task-board formatting feel like administrative overhead — even 'micromanagement.'

VS

MANAGER / VIEWER

Incentive: Predictability, cross-functional alignment, mitigating risk.

Friction: Anxiety over opacity forces interruptive check-ins & manual Slack pings — creating reciprocal friction.

THE RESOLUTION

Neither party wants to spend time on manual tracking, yet both suffer when commitments fail silently. The system must act as an objective, automated proxy — giving managers visibility without adding administrative friction for creators.

12 Ideas, Prioritized with RICE

SOLUTION IDEA	REACH	IMPACT	CONF.	EFFORT	SCORE	RANK
Auto-Nudge Email Bots (External)	500	3	80%	2	600	1
Internal Smart Reminders (Slack/Teams)	800	2	80%	2	640	2
Bi-directional Jira/Asana Sync	400	2	70%	3	187	5
AI Pre-Meeting Progress Check-in	600	3	75%	3	450	3
Manager Visibility Dashboard	300	2	80%	2	240	6
Escalation Rules Engine	200	3	70%	2	210	7
External Document Intake Portal	350	3	80%	3	280	4

RICE Score = (Reach × Impact × Confidence) ÷ Effort

REMAINING IDEAS EXPLORED (NOT SHORTLISTED)

Smart Deadline Extender · Automated Notion/Doc Action Log · Voice-to-Task Quick Add · Peer Accountability Tags · Post-Meeting Closure Scorecard

Top 2 by RICE score → Internal Smart Reminders (640) and Auto-Nudge Email Bots (600) — both address the #1 research finding: commitments fail because owners forget or clients are unreminded.

Two Solutions, One Coherent Direction

01

Context-Aware Smart Nudges

(Internal + External, Combined)

WHAT IT IS

Automated intelligent reminders dispatched via Email (external clients who forget documents) and Slack/Teams (internal team members).

WHY WE CHOSE IT

Directly addresses the primary research finding — commitments fail because clients forget or owners get buried in multitasking. Solves the external bottleneck without forcing clients into enterprise tools.

02

AI Pre-Meeting Progress Check-In

& Status Sync

WHAT IT IS

An automated check-in loop where the AI asks task owners for updates before the next meeting, updating status logs transparently.

WHY WE CHOSE IT

Bridges the gap between static transcripts and active execution — eliminating manual status-chasing meetings entirely.

Fireflies as a Closed-Loop Execution Engine

Rather than a passive 'system of record' that stops when the call ends, Fireflies becomes a Closed-Loop Execution Engine — taking meetings from spoken word → instant capture → automated tracking → honest closure.

TRADE-OFF ANALYSIS

Accountability vs. Autonomy

Prioritizes balanced guidance (soft nudges) over hard enforcement. Automates reminders to remove admin fatigue — but execution and date renegotiation stay in the human owner's hands.

Automation vs. User Control

Automates tracking loops and reminder dispatch, but gives users ultimate control to approve, modify, or dismiss tracked commitments — so no one feels micromanaged by an overzealous bot.

This direction knowingly sacrifices instant 100% automation for a brief human review step — trading a split second of interaction for accuracy in task ownership.

Smart Nudges, Brought to Life

fireflies.ai/features.architect.space

WHAT THE PROTOTYPE DEMONSTRATES

1

Action-Item Review Modal

Post-meeting, users verify, edit, or reassign extracted commitments before tracking begins — no silent AI errors slip through.

2

Enable Smart Tracking

A single click activates lifecycle tracking on any extracted commitment — internal or external, no extra setup.

3

Context-Aware Nudges

Slack/Teams pings for internal owners; polite auto-email + magic link for external clients — matched to where people already work.

4

Status: Resolved / Extended / Dropped

Every commitment reaches an honest, explicit end-state — never silently forgotten.

Bottom-Up Adoption, Self-Reinforcing Loop

LAUNCH SEGMENT

B2B SaaS Product & Engineering teams — daily standups & sprint planning mean unclosed commitments immediately block dev cycles.

FIRST-WEEK ACTIVATION

Static summary → 1-click 'Enable Smart Tracking' button on every extracted item. Zero setup friction to first value.

TEAM EXPANSION MODEL

Individual activates tracking → clean automated status updates push into shared Slack/Notion channels → coworkers see it work instead of manual nagging → they install Fireflies for their own meetings.

GROWTH / BEHAVIOR LOOP

↪ Loop closes: resolved commitments reduce backlog clutter, making the next meeting shorter and building trust that drives deeper adoption.

BUSINESS IMPACT — 28% → 45%

Moving from a 'nice-to-have' transcript archive to a mission-critical execution engine embeds Fireflies in daily operations. A 17-point resolution-rate improvement directly translates to reduced project delays for enterprise buyers — justifying higher-tier workspace pricing.

A 3-Phase, Risk-Managed Rollout

NORTH STAR METRIC

Commitment Closure Rate

Target: 45% (up from the 28% research baseline)

Proves Fireflies is moving users from passive note-taking ('system of record') to active completion ('system of action').

Metrics That Prove — and Protect — the Shift

SUPPORTING METRICS

Time-to-Resolution

<4 days avg (leading)

Ownership Share

>85% items w/ owner+deadline (leading)

Repeat Closure Rate

Consistent weekly closure (lagging)

BUSINESS & EXPANSION METRICS

Net Revenue Retention

Closed-loop workspaces vs standard churn

Paid Conversion Rate

Free→Pro upgrades after hitting tracking limits

Workspace Expansion

Seat growth as coworkers join the loop

GUARDRAIL METRICS — SAFETY & QUALITY

Notification Opt-Out

<5% threshold — adjust nudge frequency if exceeded

Performative Closure Check

Verify linked Jira/Notion items actually progressed

Extraction Precision

AI must flag true action items, not casual remarks

Surveillance Anxiety Index

Dashboard used for support, not micromanagement

EVENT TRACKING SPECIFICATION

commitment_extracted · smart_nudge_sent · task_marked_resolved · deadline_extended · nudge_opt_out

The Closed-Loop, Actually Wired Together

Make.com Scenario: eu1.make.com/public/shared-scenario/IMOPshItBSs/integration-webhooks

Fireflies Webhook
meeting.processed

Database Router
Log to Supabase

Conditional Split
Internal vs External

INTERNAL PATH

1. Slack/Teams Interactive Nudge Bot
2. User Clicks 'Done'
3. Status: Resolved

EXTERNAL PATH

1. Automated Email + Magic Link (SendGrid)
2. Client Uploads File
3. Status: Resolved

Eliminates manual copy-paste from a static Fireflies summary into Slack/email. Bridges the exact gap identified in research — the moment between 'meeting ends' and 'task due date' — driving resolution from the 28% baseline toward the 45% target.

Where This Could Fail — and How We Prevent It

RISK	THE PROBLEM	MITIGATION
Bad AI Extraction / Misattribution	AI mistakes casual talk for a firm commitment or assigns wrong owner	1-click Action Item Review Modal before tracking starts
Accent & Context Barriers	Diverse accents / jargon cause transcription misinterpretation	Custom vocabulary settings + easy manual correction
Notification Fatigue	Too many reminders → users disable or view as surveillance	1-click opt-out, intelligent batching, soft guidance only

TRADE-OFFS

Accountability vs. Autonomy — we chose employee trust over corporate surveillance (no auto-reporting missed deadlines to leadership).

Speed vs. Precision — we chose a brief user review step over 100% instant background automation.

WHAT WE WILL NOT BUILD

No full Kanban/Gantt boards, sub-task breakdowns, or time trackers.

No heavy task-execution management — Fireflies stays a meeting intelligence & follow-up engine. Deep execution hands off to Jira/Notion/Linear via sync.

CONSTRAINTS: V1 depends on meeting-platform permissions (Zoom/Meet/Teams) and messaging APIs (Slack/Outlook) for reminder dispatch — platform rule changes could restrict automation depth.

THE STORY, END TO END

From a Write-Only Memory Layer to a Closed-Loop Execution Engine

28% → 45%

Commitment Closure Rate — our North Star, grounded in real research

4 Interviews

Direct evidence: capture works, follow-through doesn't
